BOOK SYNOPSIS

Most available material on Lean describes applications only in the assembly industries: automotive, machinery, computers, appliances, and the like. This book describes the application of Lean Manufacturing concepts to the process industries: sheet goods, fibers, architectural and automotive paints, food, beverage, plastics, synthetic rubber, batch chemicals, fertilizers, and pharmaceuticals. The book begins by describing characteristics which differentiate the process industries from assembly manufacturing, particularly those which influence how Lean must be applied for greatest benefit. Factors affecting dynamic flow behavior through each of the two are described, as well as a hypothetical process industry example, which is used throughout the book to illustrate application of specific lean tools.
